# TRAUMA SIMULATOR

> **Exonicus Trauma Simulator is a virtual reality emergency training simulator that helps train critical life saving decision making skills in a safe environment.**

> Trauma Simulator is complex medical decision trainer, which can be placed in an endless number of environments and internally scaled to multiple patients. The user is presented with an unstable trauma patient with a random injury. The physiology engine settings are selected to result in the patient's death in 2-2.5 minutes, if the player does not identify the injury and complete appropriate intervention. The user must keep the patient alive for a minimum of 5 minutes. This is our primary endpoint for the user. Additional factors such as hand washing, complete assessments are tracked/graded, but do not affect the patient's immediate survival. One hundred and thirty standard trauma care actions are also available and tracked.
